

### **Wireless Hacking**

### Chun-Jen (James) Chung

### Arizona State University

## Wireless Equipment

### Windows x. Linux

- Windows
  - Wireless NIC drivers are easy to get
  - Wireless hacking tools are few and weak
    - Unless you pay for AirPcap devices or OmniPeek
- Linux
  - Wireless NIC drivers are hard to get and install
  - Wireless hacking tools are much better

## OmniPeek

- WildPackets now packages AiroPeek & EtherPeek together into OmniPeek
- A Windows-based sniffer for wireless and wired LANs
- Only supports a few wireless NICs

## Chipsets of Wireless Cards

- For Linux, the best chipsets to use are Orinoco, Prism2.x/3, Atheros, and Cisco
- A good resource is at Madwifi
  - Go to http://madwifiproject.org/wiki/Compatibility

### Antennas

- Omnidirectional antenna sends and receives in all directions
- Directional antennas focus the waves in one direction
  - The Cantenna shown is a directional antenna

### **Stacked Antennas**

- Quad stacked antenna
  - Four omnidirectional antennas combined to focus the beam away from the vertical
  - Beamwidth: 360° Horizontal,
    15° Vertical
  - Can go half a mile or more see right

# WISPer

• Uses "multi-polarization" to send through trees and other obstructions

## Global Positioning System (GPS)

- Locates you using signals from a set of satellites
- Works with war-driving software to create a map of access points

Arizoi

## Pinpoint your Location with Wi-Fi

- Skyhook uses wardriving to make a database with the location of many Wi-Fi access points
- Can locate any portable Wi-Fi device
- An alternative to GPS

San Francisco Coverage Area

## iPhone vs. Android

• The iPhone combines GPS, Wi-Fi, and cell tower location technology to locate you

• You can wardrive with the Android phone and Wifiscan

## **War-Driving Software**

# Terms

- Service Set Identifier (SSID)
  - An identifier to distinguish one access point from another
- Initialization Vector (IV)
  - Part of a Wired Equivalent
     Privacy (WEP) packet
  - Used in combination with the shared secret key to cipher the packet's data

#### **Choose a wireless network**

Click an item in the list below to connect to a wireless network in range or to get more information.

((ဓူ))	asu	Connected 👷
U	Unsecured wireless network	
<mark>((ດູ))</mark>	CUBIC	
U	Unsecured wireless network	
<mark>((၀ူ))</mark>	xprobot	
U	😚 Security-enabled wireless network (WPA2)	•a000
<mark>((ດູ))</mark>	brickyard	
U	Unsecured wireless network	

## NetStumbler

- Very popular Windows-based war-driving application
- Analyzes the 802.11 header and IV fields of the wireless packet to find:
  - SSID
  - MAC address
  - WEP usage and WEP key length (40 or 128 bit)
  - Signal range
  - Access point vendor

## How NetStumbler Works

- NetStumbler broadcasts 802.11 Probe Requests
- All access points in the area send 802.11 Probe Responses containing network configuration information, such as their SSID and WEP status
- It can also use a GPS to mark the positions of networks it finds

#### W Network Stumbler - [20090422111907]

## NetStumbler Countermeasures

- NetStumbler's relies on the Broadcast Probe Request
- Wireless equipment vendors will usually offer an option to disable this 802.11 feature, which effectively blinds NetStumbler
  - But it doesn't blind Kismet

## Kismet

- Linux and BSD-based wireless sniffer
- Allows you to track wireless access points and their GPS locations like NetStumbler
- Allow spectrum analysis (with Wispy)
- Sniffs for 802.11 packets, such as Beacons and Association Requests
  - Gathers IP addresses and Cisco Discovery Protocol (CDP) names when it can
- Kismet Countermeasures
  - There's not much you can do to stop Kismet from finding your network

### **Kismet Features**

- Windows version
  - Runs on cygwin, only supports two types of network cards
- Airsnort compatible weak-iv packet logging, however airsnort is too OLD, use aircrack-ng instead.
- Runtime decoding of WEP packets for known networks

### Kismet

You can use Backtrack

- <u>http://www.remote-</u>
   <u>exploit.org/backtrack\_download.html</u>
- However, here our demo is based on ubuntu, NIC
   Atheros AR5001X+, internal wireless card.
  - Madwifi <u>http://www.madwifi.com/</u>

## **Kismet Screenshot**

# Wardriving

- Finding Wireless networks with a portable device
  - Image from overdrawn
     .net

### Vistumbler (http://www.vistumbler.net/)

- Find Wireless access points
- GPS Support
- Compatible with Netstumbler
- Export access point GPS locations to a google earth kml file
- Live Google Earth Tracking Auto KML automatically shows access points in google earth.
- Speaks Signal Strength using sound files, windows sound api, or MIDI
- Open Source

## Cain (http://www.oxid.it/)

- It uses the Winpcap Packet Driver to control the wireless network card. Access points and ah-hoc networks are enumerated using 802.11 OIDs from Windows DDK at intervals of five seconds and WLANs parameters (MAC address, SSID, Vendor, WEP Encryption, Channels....) are displayed in the scanner list.
- With Abel, it can crack WEP's password

16,743,561 points from 977,853,683 unique observations.

• WiGLE

(http://www.wigle.net/)

- Collects wardriving data from users
- Has over 16 million records

Arizona State University ve Tempe as of 4/22/09

### Wireless Scanning and Enumeration

- Goal of Scanning and Enumeration

   To determine a method to gain system access
- For wireless networks, scanning and enumeration are combined, and happen simultaneously

## **Wireless Sniffers**

- Not really any different from wired sniffers
- There are the usual issues with drivers, and getting a card into *monitor* mode

## Wireshark WiFi

### - Enable the wireless device in monitor mode

## Identifying Wireless Network Defenses

# SSID

- SSID can be found from any of these frames
  - Beacons
    - Sent continually by the access point (unless disabled)
  - Probe Requests
    - Sent by client systems wishing to connect
  - Probe Responses
    - Response to a Probe Request
  - Association and Reassociation Requests
    - Made by the client when joining or rejoining the network
- If SSID broadcasting is off, just send adeauthentication frame to force a reassociation

## **MAC Access Control**

- Each MAC must be entered into the list of approved addresses
- High administrative effort, low security
- Attacker can just sniff MACs from clients and spoof them

## Gaining Access (Hacking 802.11)

# Specifying the SSID

• In Windows, just select it from the available wireless networks

Arizon

- Click on set up a wireless network from a home or small office.
   Wireless Network Setup Wizard
- And then input the SSID

🖤 Wireless Network	Wireless Network Setup Wizard
Network Tasks	Create a name for your wireless network.
Refresh network list Set up a wireless network for a home or small office	Give your network a name, using up to 32 characters. Network name (SSID):
Related Tasks	Automatically assign a network key (recommended) To prevent outsiders from accessing your network, Windows will automatically assign a secure key (also called a WEP or WPA key) to your network.
<ul> <li>Change the order of preferred networks</li> <li>Change advanced settings</li> </ul>	Manually assign a network key Use this option if you would prefer to create your own key, or add a new device to your existing wireless networking using an old key.
	Use WPA encryption instead of WEP (WPA is stronger than WEP but not all devices are compatible with WPA)
a	< Back Next > Cancel

## Changing your MAC

- In Windows Vista
  - Rund regedt32
  - Navigate to HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\Class\{4 D36E972-E325-I1CE-BFC1-08002BE10318}
  - Find REG\_SZ name NetworkAddress and change it
- SMAC is easier

# Attacks Against the WEP Algorithm

- Brute-force keyspace takes weeks even for 40bit keys (use Cain & Abel)
- Collect Initialization Vectors, which are sent in the clear, and correlate them with the first encrypted byte
  - This makes the brute-force process much faster

### **Tools that Exploit WEP Weaknesses**

- Aircrack-ng or AirSnort (old)
- kismet
- Cain & Abel
- WLAN-Tools
- DWEPCrack
- WEPAttack

Cracks using the weak IV flaw

• Best countermeasure – use WPA/WPA2

## WEP Crack Demo

- This demo is conducted in my home (please do not try it again <sup>(C)</sup>)
- Network configuration.

### Run kismet to discover networks

## Use aircrack-ng to crack my

## HotSpotter

- Hotspotter--Like SSLstrip, it silently replaces a secure WiFi connection with an insecure one
- Works because Windows allows it, apparently happy to accept an insecure network as part of the same WLAN

## Lightweight Extensible Authentication Protocol (LEAP)

## What is LEAP?

- A proprietary protocol from Cisco Systems developed in 2000 to address the security weaknesses common in WEP
- LEAP is an 802.1X schema using a RADIUS server
- As of 2004, 46% of IT executives in the enterprise said that they used LEAP in their organizations

## The Weakness of LEAP

- LEAP is fundamentally weak because it provides zero resistance to offline dictionary attacks
- It solely relies on MS-CHAPv2 (Microsoft Challenge Handshake Authentication Protocol version 2) to protect the user credentials used for Wireless LAN authentication

## MS-CHAPv2

- MS-CHAPv2 is notoriously weak because
  - It does not use a SALT in its NT hashes
  - Uses a weak 2 byte DES key
  - Sends usernames in clear text
- Because of this, offline dictionary and brute force attacks can be made much more efficient by a very large (4 gigabytes) database of likely passwords with precalculated hashes

## Cisco's Defense

- LEAP is secure if the passwords are long and complex
  - 10 characters long with random upper case, lower case, numeric, and special characters
- The vast majority of passwords in most organizations do not meet these stringent requirements
  - Can be cracked in a few days or even a few minutes

### **LEAP** Attacks

### Anwrap

- Performs a dictionary attack on LEAP
- Written in Perl, easy to use

## Asleap

- Grabs and decrypts weak LEAP passwords from Cisco wireless access points and corresponding wireless cards
- Integrated with Air-Jack to knock authenticated wireless users off targeted wireless networks
  - When the user reauthenticates, their password will be sniffed and cracked with Asleap

## Countermeasures for LEAP

- Enforce strong passwords
- Continuously audit the services to make sure people don't use poor passwords

WPA/WPA2

- WPA/WPA2 is strong
- No major weaknesses
- However, if you use a weak Pre-Shared Key, it can be found with a dictionary attack
- Tool: Aircrack-ng

## Denial of Service (DoS) Attacks

- Radio Interference
  - 802.11a, 11b, and 11g all use the 2.4-2.5GHz ISM band, which is extremely crowded at the moment
- Unauthenticated Management Frames
  - An attacker can spoof a deaauthentication frame that looks like it came from the access point
  - wlan\_jack in the Air-Jack suite does this
